

ShopStore — where the counter talks to the book

Next.js + Tailwind in the browser. Node.js API on Render. MongoDB holds the stock.

What the counter does not keep in this book

No accounts ledger

No GST invoice

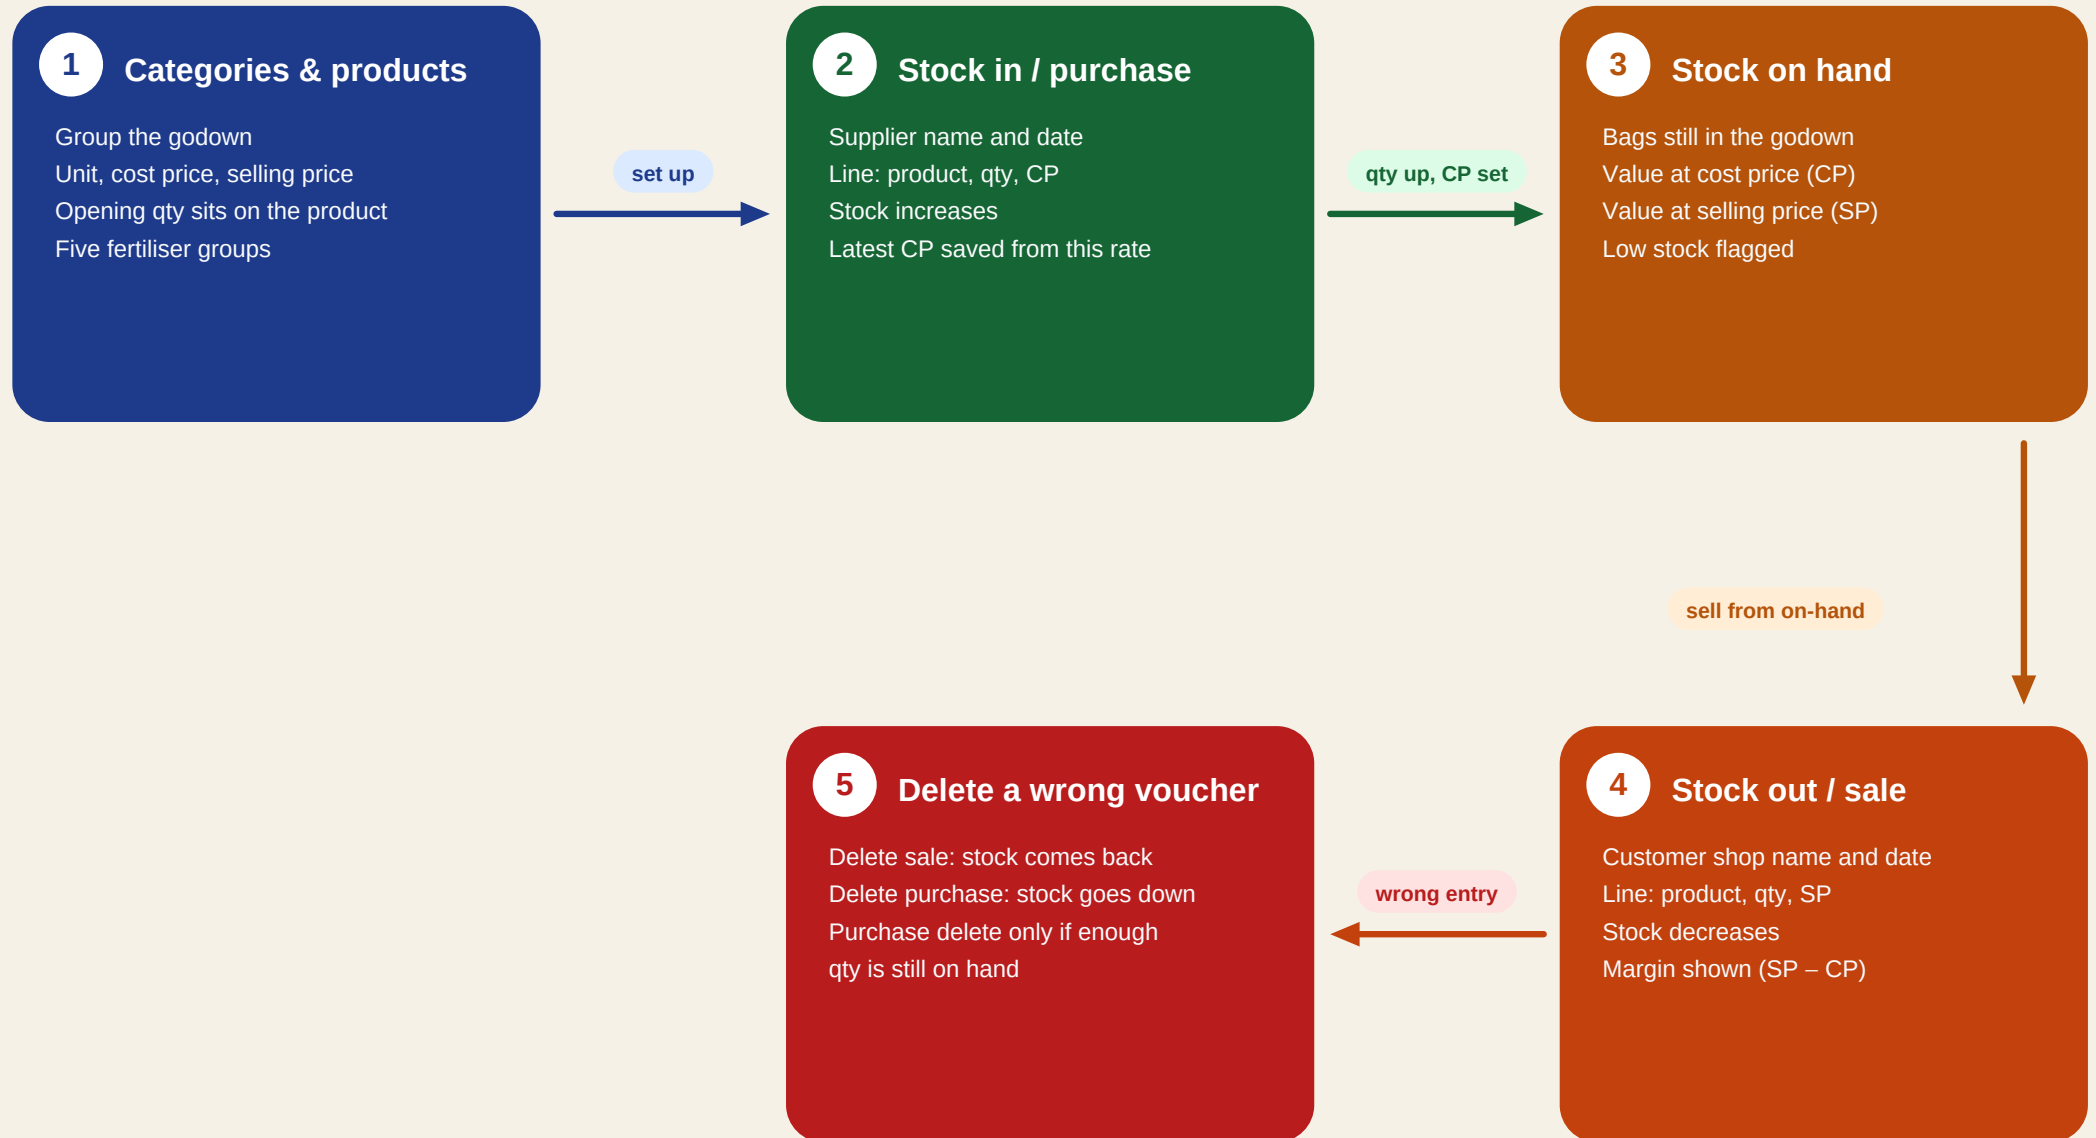

No login

Stock in and stock out only

B2B counter staff. Plain screens. The bag count and the two prices are the whole job.

Five steps from the product card to a reversed voucher

Short labels on each box say what the counter just did to the godown.

What the book refuses, and what a delete puts back

Urea 46% N, 45 kg bag — one morning, so the arrows have numbers on them.

Cannot sell more than stock

Ask for 20 bags when 12 are on hand.
The sale is refused. Qty stays 12.
The selling price is not changed.

Delete sale restores stock

A wrong shop name on the voucher.
Delete it. The bags return to the godown.
The posted SP stays as the latest rate.

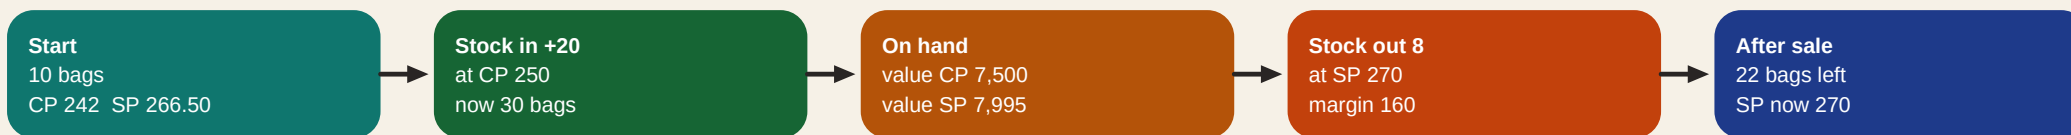

Delete purchase only if stock remains

The voucher put 20 bags in.
If 15 were already sold, delete is refused.
Stock and the voucher both stay as they are.

Latest CP / SP comes from the voucher

Purchase rate becomes the product CP.
Sale rate becomes the product SP.
The last line on the voucher wins.

Worked urea line

Then a wrong voucher

Delete that sale of 8 bags to Sharma Krishi Bhandar. Stock returns from 22 to 30. SP stays 270.
Buy was 20 bags. Sell 25 more so only 5 remain, then try to delete the purchase. The book refuses.
Gross margin on the dashboard is today's sales minus the cost price captured on each sale line.
